Zero Trust: What are we trusting?

Person **Session** **Resource** **Data** **Action**

A successful sign-in answers only part of the question.

Meet the Zero Trust Power Couple

Entra

The bouncer

Who may enter?
Under which conditions?

Purview

The data owner

What is the data?
What use is permitted?

Copilot operates within these effective controls

THE STORY

Why identity needs data protection

THE START	THE GAP	THE DATA	THE CONNECTION	THE PAYOFF
Identity opens the door	Beyond sign-in	The data's own rules	Connected controls	AI needs both layers

Authenticated does not mean authorised for data use.

ACT 1 IDENTITY GUARDS THE DOOR

Identity guards the door

DEMO 1

Per-Torben on different devices

Conditional Access steps in

AI did not create oversharing

One experience, multiple control decisions

ACCESS	**Identity signals** User, device, risk	→ **Conditional Access** Session conditions	→ **M365 permissions** Reachable content
DATA USE	**Container controls** Workspace settings	→ **Item protection** Classification and encryption	→ **DLP** Permitted activities

Copilot interaction Within the effective controls

Labels are policy anchors

Container

Teams, groups and sites

Workspace sharing

Device access

Authentication context

Item

Documents and emails

Classification

Encryption and usage rights

DLP conditions

A labelled site does not automatically encrypt its files.

ACT 2 THE DATA HAS ITS OWN OPINION

The data says no

DEMO 2

Sensitive information detection

Sensitivity labels

External sharing

DLP enforcement

The technical marriage

01 **Aurora site**

Highly Confidential label

02 **Authentication context**

c1

03 **Conditional Access**

Scoped to c1

Site-specific Conditional Access policies

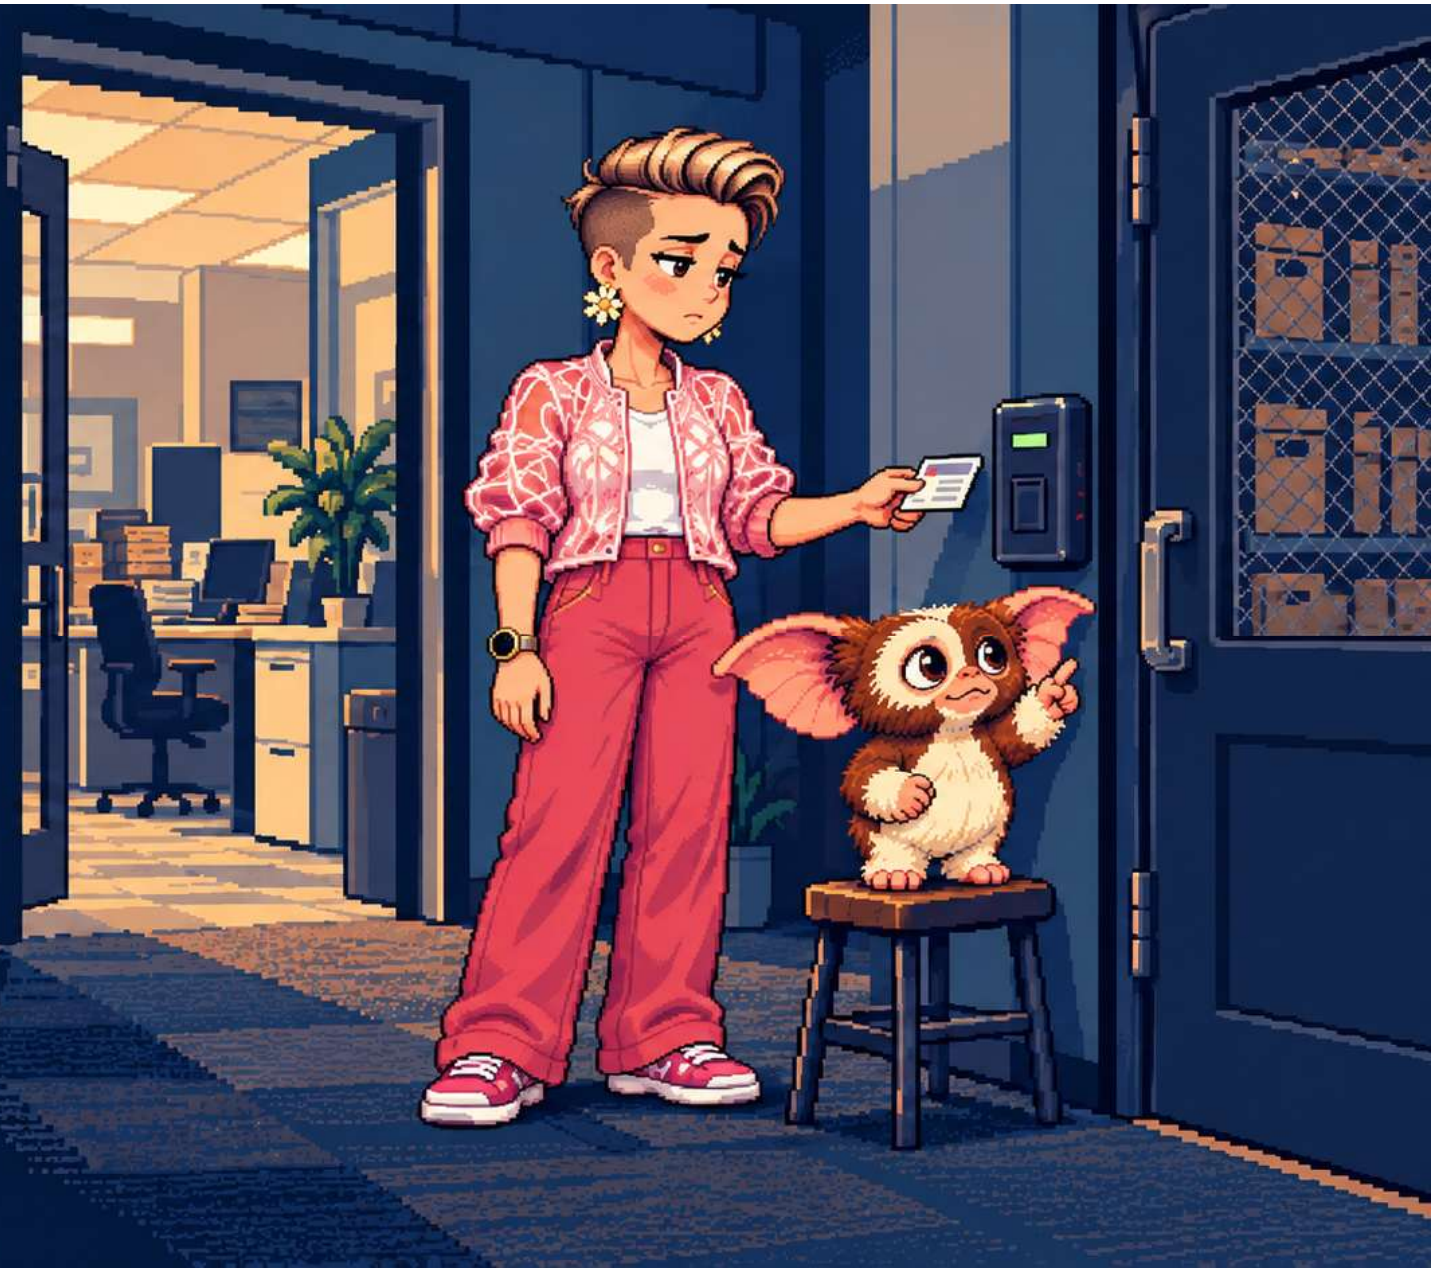

File labels, encryption and usage rights remain separate.

ACT 3 IDENTITY AND DATA COMMUNICATE

Authentication context and labels

DEMO 3

- Site sensitivity label
- Authentication context
- Conditional Access
- Step-up authentication

Same user, same device, same prompt

Only the effective content controls vary

Aurora document	Access	Encryption rights	Copilot DLP
Public announcement	Yes	Not encrypted	No block
Internal operating model	Yes	Not encrypted	No block
Confidential forecast	Yes	Not encrypted	Block rule
Highly Confidential plan	Yes	VIEW, no EXTRACT	

Same prompt. Different outcome.

DEMO 4

“Summarise everything we know about Project Aurora.”

Copilot and protected grounding data

Can I reach it? → **Microsoft 365 permissions**

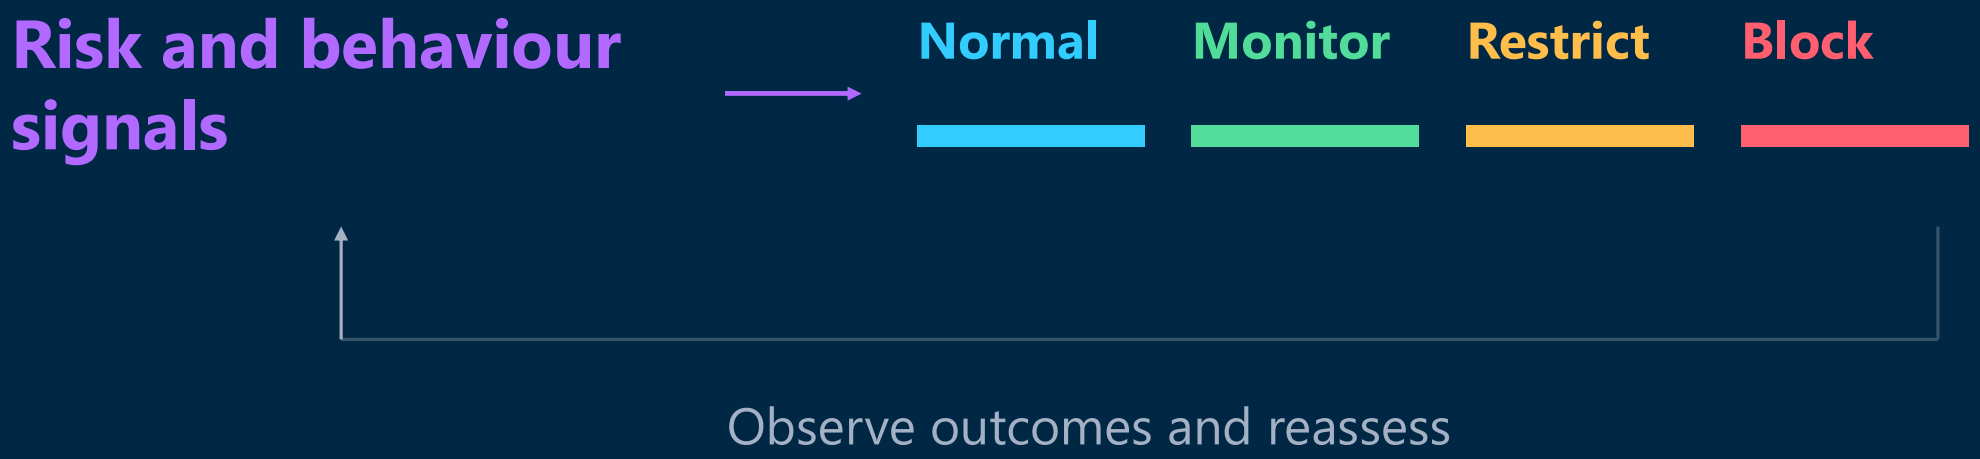

May I use it? → **Labels, encryption and rights**

May AI process it? → **DLP in supported scenarios**

Copilot does not grant new permissions!

Adaptive protection

A thermostat, not a thermometer

The practical architecture

IDENTITY	**Who is requesting?**	Entra identity
	May this session occur?	Conditional Access
DATA USE	**What can the user reach?**	M365 permissions
	What is the information?	Purview labels
	What may happen to it?	Encryption, rights and DLP
	May AI use it in this interaction?	Copilot + effective controls
EVIDENCE	**What evidence remains?**	Sign-in logs + Purview Audit

ACT 3 IDENTITY AND DATA FINALLY COMMUNICATE

Couples therapy

ENTRA

“I trusted the session.”

PURVIEW

“I did not authorise that use of the merger document.”

Practical take-home pattern

DEFINE

01 One sensitive scenario

02 User and identity conditions

03 Workspace and permissions

CONFIGURE + TEST

04 Container and item sensitivity

05 Access, encryption and DLP

06 Same prompt, different rights

Test the effective rights and policies, then record the evidence.

Security requires both

Identity

Who gets through the door
and under which conditions

Data protection

What may happen after they enter

Thank You
